You must be aware that the Windows version of a desktop application is generally very different from the one that runs in the web browser. In the world of applications, a desktop one is not something that you would just consider in light of performance. It must be designed in order to fit all your requirements and work in different ways. The developers behind this particular application have strived to give you the same functionality as the desktop version of an application, while at the same time not leaving out any of the features that you would need to make writing on the web even more fun. Sometimes, though, there are things that could be considered essential, but that are simply not there. Here are some of the most common examples. Windows 10 dark theme Windows 10 comes with a few built-in themes, but there is one that is much more popular than the others: the dark theme. If you want to see the dark theme in action, there are two ways to do so. First, simply go to Settings > Personalization > Colors and click on the system color icon, which will bring up the system color picker. From here, simply change the color theme to Dark and enjoy the change. There are also a few third-party apps that could do the same for you. A few examples include Window Color Picker, and MyDark Windows 10. Power options Some users complain that they never see the power options page, or they don't see enough options. It happens mostly if you're not using the right settings on the computer. You can easily access these options from Settings > System. In order to do so, you will need to select the Power Options, click on Change settings, and from there you can adjust what you want to change. Windows Updates Another thing that users seem to miss is the Windows Update notification. To see these updates, you need to go to Settings > Update and Security > Windows Update, and there you will see the option to turn on the option to see the available updates. These are just some of the things that could be considered essential for any Windows 10 user, but they're still missing in some applications. Text editors Windows applications often lack some of the basic functionality that could make life easier. Sometimes this is a known issue, but other times, such as with text editors, the issue is really a lack of effort in making the application fit the needs of people.
